

# Machine management: How does one enable the spice client for a machine?

Configure a machine to use the spice protocol by

- Navigate to **Workspace->Deployments->Machines->My**
- Select the machine you wish to configure, and click on **Ops->Edit Config**
- Edit the contents to match the example below

```
<graphics autoport='yes' keymap='en-us' listen='SpIcE.server name' port='-1' type='vnc' />
</devices>
<infracc>
  <console>spice</console>
</infracc>
```

- Note the alternating case in **SpIcE**. That is required in the graphics tag only.
- **Save** changes
- Now start the machine (**Ops->Start**) before grabbing it's console (**Ops->Console**)
