

Networking: Why is the {avatar_c}-server awfully slow?

Symptom:

All/any requests to the {avatar_c}-server take inordinately long to get a response.

Probable Cause:

most likely scenarios is that dnsmasq on the {avatar_c}-server has been configured with an upstream name server that can no longer be reached.

Recommendation (needs Administrator privileges):

Either avoid referring to upstream nameservers

by commenting it out the line starting with "resolv-file=" and optionally uncomment the line that starts with "no-resolv" in the file /etc/dnsmasq.d/dnsmasq.conf,

or

provide a valid nameserver entry in the file /etc/dnsmasq-upstream-resolv.conf
