

# General: How to configure postboot to enable shutdown of thinclient ?

To enable shutdown of thinclient perform following steps on "**infracc-server**"

1. `sudo bash`
2. `cd /var/www/post-boot/thinclient`
  
3. if file `scripts.lst` does not exist then follow step 3.a otherwise skip to step 4
  - 3.a) `bash gen-list.sh`
  
4. `vim scripts.lst`
  
5. uncomment line "**common/powersave.sh**" and save file.
6. come out of thinclient directory; do `cd ..`
  
7. `bash update.sh`
  
8. You can check on the thinclient terminal if the file "**.powersafe-enabled**" is created.
  1. `cd /tmp/`
  2. `ls -lah`
  
9. Now to test whether it is working or not, wait till thinclient triggers screen sever, when it triggers screen sever, it will shutdown system.
