

# General: Can a Admin user snapshot a user machine ?

Two scenarios are possible in this case

## Case 1:

An unrestricted user deploys a single machine and the admin snapshots that machine. In this case, everything works just fine, as expected (snapshot is visible in Library).

## Case 2:

The admin snapshots a machine that was group deployed to a set of users.

- The snapshot goes through, but the fact does not reflect in the library.
- This is because "labs" are not visible through the library interface.
- However, the admin can access this snapshot by "searching" for the machine on the library tab.
